Inventory Management System

Servicing (Job Costing) Module

The Servicing (Job Costing) Module has been added to address the demand for Job Costing/Servicing functionality. This module can be found under the Modules>Service Repair menu.

This module includes the capability to estimate jobs/projects and to compare actual values to those estimates for variance analysis. It requires the booking of time as well as allocating consumed materials. Time is booked against pre-defined operation schedules, which will have flexibility to be changed. Items to be purchased can be described and estimated. A new module for the Purchasing Agent will be available to disclose all those items that the service crew needs to complete a job.

This module can be linked to the General Ledger, with a work-in-progress integration account setup to allow for general ledger accumulation of costs during a project.

The *Main Console* is where the Service Module options can be setup, including the start of a new Repair Order, the booking of both materials and time, as well as generating purchase orders and the receiving of goods for your Service Orders

The *Main Screen* allows users to enter the service item, any comments related to the service item, the association of it with a customer, as well as assigning a document number and define the anticipated completion date.

Repair Order - RO-1

1	OIL C...	OIL CHANGE		1.00	Each	91...	116.72	24.87	27.0...	Completed	311

The Estimation Screen allows the entry of operations, materials and other costs, as well as setting Markup % rates. This enables you to define and print a detailed quote for your customer related to the service order. Further, you can view the actuals and/or variances to determine if the service order is running under or over budget with ease.
